

# **Report on Information Assurance Curriculum Development**

## **June 1, 2002**

**Melissa Dark**  
**CERIAS Purdue University**  
**dark@cerias.purdue.edu**

**Jim Davis**  
**Iowa State University**  
**davis@iastate.edu**

### **Abstract**

This report details the participants, process, and output from two curriculum development workshops. The first was held in July 2001 (See Appendix A for a list of the participants) and the second was held in April 2002 (see Appendix B). The workshops were sponsored in part by the National Science Foundation Grant DUE # 0124409.

The objective for this project is to develop a curriculum framework for undergraduate and graduate programs in Information Assurance. The framework includes: identification of broad areas of knowledge considered important for practicing professionals in information assurance, identification of key learning objectives for each of these areas, identification of a body of core knowledge and skills that all programs should contain, and a model curriculum including scope and sequence. The framework's development is undertaken via workshops and working groups of leading information assurance educators leading to a draft document which will then be widely distributed for comment and dissemination.

### **The Task at Hand**

Curriculum design and development means many things to many people. This is especially true in education where individuals have tacit understanding of curriculum design, development, and enactment. For the purpose of this workshop, we turned to the curriculum and instruction literature to establish a working definition that could serve as a guide for discussion. We used these working definitions to discuss and come to a common understanding of the task at hand and to guide our work. It should be noted that this work has really just begun. Therefore, the definitions provided below will continue to guide our work as we move forward.

Curriculum design is concerned with making decisions about the **scope, organization, and sequence** of the **content** at the macro level (Smith & Ragan, 1999). **Content** then can be considered as the topics to be taught (what should be taught?) **Scope** becomes a question of how much students should know (to what degree should students be taught this depends upon the degree of understanding/knowledge that you intend them to have upon completion). **Organization** becomes a question of how to sequence the topics (there are a variety of organization strategies: prior knowledge, job-function, super-ordinate concepts, etc). Finally, **sequence** is the suggested ordering of content based on answers to the three prior questions.

The output of curriculum design varies according to the uses of the curriculum design/development effort. The first goal of this project is to produce a document that defines the common body of knowledge in Information Assurance, i.e., what should be taught in Information Assurance program (content). A second goal of this project is to identify key learning outcomes for each of these areas, i.e., what students should know and be able to do (scope).

With regard to content, this group was seeking to define the core curriculum where core would be viewed as the intersection of various programs. We recognize that different programs will not only have different content, but even different emphases within the core. Furthermore, the group recognized that Information Assurance is multi-disciplinary in nature, including but not limited to disciplines such as psychology, sociology, political science, law, computer science, computer engineering, and management . The multi-disciplinary nature means that what students should know and be able to do will vary across disciplines and will require that we establish stronger involvement of experts from related disciplines not involved to date. The group also recognized that what students should know and be able to do will vary by the orientation of the specific program and the type(s) of career or advanced schooling being prepared for. Given that, the group felt that we could produce a working document that defined the content, i.e., the common body of knowledge across all disciplines and types of programs, but that meaningful definition of scope would need to be more detailed and granular according to program type.

We did not have time to address depth of knowledge for different types. We think this is an important next step and should include a wider cross section of faculty from various programs. We recognize that when we define scope, an appropriate metric will be needed to indicate depth. Examples include: 1) number of hours of instruction devoted to a topic, 2) percentage of standard courses devoted to a topic, and/or 3) level of proficiency of student knowledge and skills.

The intent of this initiative is to provide a framework that serves multiple purposes including, but not limited to assisting:

- ❑ faculty and other stakeholders in identifying gaps in their existing programs,
- ❑ faculty and other stakeholders in developing new programs,
- ❑ faculty and other stakeholders in formulating articulation agreements,
- ❑ employers in assessing qualifications of graduates,
- ❑ students in understanding what is required of professionals in the field, and
- ❑ students and employees establish a common language for talking and working together on security projects, which are usually team efforts.

In terms of trying to conceptualize what a finished product might look like from this initiative, the group agreed that we were working toward a framework, but cautioned that we should not be constrained to a paper document. To provide a resource that serves the above uses requires representing a multi-dimensional manifold that includes 3 axes at a minimum; topics (content), audience, and depth (scope). It was noted that a database that allows us to extract and represent different views upon demand might be more versatile, informative, and useful.

### **The Process**

The first goal of the April workshop was to identify the content of the common body of knowledge in IA undergraduate and graduate curriculum. The guiding question was “What topics should be included in every IA (undergraduate/graduate) program?” The second goal was to delimit the above by specifying scope. Questions to be considered at this step include: “Should the student have basic conceptual and factual understanding of the content? Should the student be able to apply the principles, procedures, processes, etc, in context? Should the student

be able to synthesize principles, procedures, processes, etc., to form new ideas and solutions to ill-structured problems?”

Workshop participants split into two working groups focused either on undergraduate or graduate education, with the goal of defining the common body of knowledge for that type of program. The following day, presentations were made by each group to the entire group for discussion, review, and feedback. A current version of the working document from each group is provided later in this report. It should be noted that these documents are works in progress. The committee recognizes that they are by no means complete enough to serve their intended purposes. However, the group wants to circulate the documents throughout the development process to enable ongoing review and feedback, as well as to invite more IA educators and professionals to participate in the initiative.

The undergraduate document provides a list of main topics that should be covered in any undergraduate IA program. In an attempt to begin to establish cursory indicators of depth, three levels were assigned to each category. The levels are a derivative of the work of Robert Gagne and Benjamin Bloom in specifying types of knowledge in the cognitive domain (Gagne, 1979; Bloom, 1956). The three levels we used are: declarative, application, and synthesis. Declarative knowledge means that students should be expected to “*know that*” something is the case. Declarative knowledge includes knowing facts, concepts, principles, rules, algorithms, and so on. Application then is the ability to *use* learned material in new and concrete situations. Finally, synthesis refers to a level of understanding that is demonstrated by *creating new* (to the student) *solutions from existing knowledge*. The depth indicators on the working document represent a minimum level of understanding that all undergraduate IA students should have. We recognize that more work is needed to refine this and tailor it to different types of programs.

In the case of both the undergraduate and the graduate working documents, the group would like to note the following. The group is the most confident that the main groupings are accurate and sufficient (these are noted in bold). The group is also fairly comfortable with the second level under each of the main groupings. However, we would like to review this again ourselves and solicit the review and feedback of others not in the workshop group. The third level of topic

(that which is indented the furthest) is not meant to be a comprehensive or exhaustive list of recommended topics, rather these are examples of subtopics that could be covered.

Throughout the process, we noted a number of meta-curricular issues that were documented as follows. Several terms have multiple meaning, e.g., threat, vulnerability, validation, verification, testing, secret key, certificate, one-way functions, social engineering, risk, security, proof, policy, security tools, undergraduate, graduate, curriculum (and more to come). Care should be taken to operationally define these terms so that others (including students) can better understand their multiple meanings in context. Throughout the undergraduate curriculum we should also discuss existing tools and resources such as BugTraq, and CERT Advisories, to name a few. Depending upon the students' interests, undergraduate programs might also want to discuss open research issues. Students should be required to write large programs, maintain programs overtime, and work in teams. Students are often not trained to be professional programmers working in teams on large codes. This is perceived as a source of many security problems. IA education encompasses the issues that arose from the military defense world and has grown to include e-commerce, e-government, e-learning (and others) and students need to understand this evolution and spectrum. Students need to understand the notion of "no such thing as absolutely secure".

There are also personal characteristics associated with being an IA professional that students should understand so they can self-assess whether or not they will be satisfied with a career in IA. Such characteristics include: detail-oriented, high level of self-discipline, voluntary "paranoia". To address how to integrate detail-orientation into the undergraduate curriculum, we can look at other disciplines where attention to detail is also paramount. Finally, at the undergraduate level, it was assumed that students graduating from programs that include these topics are expected to go into the following types of careers: Low Level IT Engineer, System Administrator with a Security Specialization, Programmer with a Security Specialization, Network Engineer with Security Specialization, or a Security Software Developer. It was also assumed that students would have taken more than one 4<sup>th</sup> generation language course so that students have the ability to program.

Before presenting the output of the workshop, we would like to share action items from the workshop. The current list of topics under consideration for an undergraduate curriculum is given in Appendix C; the graduate topics are provided in Appendix D.

### **Action Items**

1. Complete this phase of the work. This includes:
  - a. preparing a report for the group to review and edit,
  - b. planning a follow up informal session for those who will be attending NCISSE,
  - c. identify opportunities to invite review and feedback by others,
    - i. NCISSE
    - ii. Discussion forums, such as Fred Cohen's SECEDU Discussion forum
  - d. looking for add-on funding to sponsor another workshop targeted for late summer or early fall 2002. Further work will be focused on identification of scope, i.e., what student should know and be able to do in different types of programs.
2. Form an advisory group to inform how to interleave this initiative with related existing curriculum efforts and other stakeholders
  - a. Related existing curriculum efforts
    - i. CNSS
    - ii. NSTISSC
    - iii. ISC<sup>2</sup>
    - iv. SANS
    - v. Other
  - b. Other stakeholders
    - i. Accounting firms
    - ii. ACM
    - iii. American Society for Industrial Security
    - iv. Association of Certified Fraud Examiners
    - v. Banking industry
    - vi. All 36 Centers of Academic Excellence in Information Assurance Education
    - vii. CERT/CC
    - viii. Cisco
    - ix. Commercial IA/Network Security/Penetration training firms
    - x. Disaster Recovery Institute international
    - xi. DoD
    - xii. FBI

- xiii. FISSEA
- xiv. HTCIA
- xv. IEEE
- xvi. ISACA
- xvii. ICCP
- xviii. IIA
- xix. NIST
- xx. NSF
- xxi. Secret Service

- c. Form a communications group that provides outreach on this initiative
- d. Consider a related initiative to establish a repository of curriculum resources, documents, and links. The goal here would be to create an exchange of teaching materials of these topics specifically as it relates to the curriculum framework being developed.

<p><b>E-commerce related issues</b> (this is a gap where we need to get input from e-commerce specialists)</p>	<b>Declarative</b>
<p><b>Develop secure network applications, server, and distributed applications.</b></p>	<b>Application</b>
<p><b>IT System and Network Security Design</b></p> <ul style="list-style-type: none"> <li>○ Discuss definitions for “secure” operating system, “secure” server</li> <li>○ Secure an operating system (minimally students should experience the process of securing some mainstream operating system and ideally have experience in multiple mainstream operating systems)</li> <li>○ Configure and manage security tools (minimally be able to install and configure one, ideally more than one) <ul style="list-style-type: none"> <li>▪ e.g., Tripwire, TCP wrapper, etc.</li> </ul> </li> <li>○ Configure and secure web browsers and web servers.</li> </ul> <p>Develop secure web applications.</p>	<b>Application</b>

<p><b>Integrative experience</b> to address an ill-defined problem with no single correct answer. The problem has social, economical, ethical, and political constraints. Involves the consideration of more than one design alternative and requires students to work in a team environment. The end result of this integrative experience is a real product (an implementation of a server, service, etc.). Students also produce a written and oral report. There is a requirement for self-assessment. (This can be done with a real customer. This usually requires additional time. If this approach is desired, it is suggested that this be a two semester experience).</p> <p>E.g.:</p> <ul style="list-style-type: none"><li>○ Configure and manage routers</li><li>○ Configure and manage Ethernet switches to include content-aware/Layer 1-3 and 4-7</li><li>○ Configure and manage firewall systems<ul style="list-style-type: none"><li>▪ Software and appliance-based</li></ul></li><li>○ Configure and manage VPN networks</li><li>○ Design and secure wireless and voice over IP applications</li></ul>	<p><b>Synthesis</b></p>

## Appendix D Graduate Knowledge and Skills

### Cryptography

<ul style="list-style-type: none"> <li>The development of cryptography               <ul style="list-style-type: none"> <li>First principles                   <ul style="list-style-type: none"> <li>Protecting confidentiality</li> <li>Ensuring integrity</li> <li>Guaranteeing authenticity</li> <li>Classical cryptosystems</li> </ul> </li> <li>Historical cryptography                   <ul style="list-style-type: none"> <li>Substitution ciphers</li> <li>Transposition</li> <li>Frequency-based cryptanalysis</li> <li>Codes</li> <li>Code machines</li> <li>One-way hash functions</li> </ul> </li> </ul> </li> <li>Fundamentals               <ul style="list-style-type: none"> <li>Block vs stream ciphers</li> <li>Chaining</li> <li>Threshold cryptography</li> <li>Zero-knowledge proofs</li> <li>Oblivious transfer</li> <li>Pseudo-random number generators</li> <li>Secret sharing</li> <li>Key management and key distribution</li> <li>Keyspace</li> </ul> </li> <li>Important symmetric algorithms               <ul style="list-style-type: none"> <li>DES</li> <li>AES</li> <li>Clipper / Skipjack</li> <li>RCn</li> </ul> </li> <li>Asymmetric algorithms               <ul style="list-style-type: none"> <li>Public key cryptography</li> <li>RSA</li> <li>Elliptic curve cryptosystem</li> <li>Digital Signature Algorithm</li> </ul> </li> <li>Cryptographic protocols               <ul style="list-style-type: none"> <li>Identification, authentication and authorization</li> <li>Role of encryption</li> <li>Frameworks for secure e-commerce</li> <li>Third-party certification authorities</li> <li>Single sign-on</li> <li>Interoperability</li> <li>Products</li> <li>Web sites</li> <li>Overview of network applications of crypto</li> <li>Electronic voting</li> <li>E-commerce</li> <li>Electronic contracts &amp; non-repudiation</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Hardware implementations               <ul style="list-style-type: none"> <li>Cost/benefit analysis</li> <li>Network Topology</li> <li>Enforcement</li> <li>Digital rights</li> <li>Vulnerabilities</li> <li>Crypto processors</li> </ul> </li> <li>Digital signatures               <ul style="list-style-type: none"> <li>Definitions</li> <li>Benefits</li> <li>Mechanisms</li> <li>Certificates</li> </ul> </li> <li>Public key infrastructure and certificate authorities               <ul style="list-style-type: none"> <li>Need for public key cryptosystem</li> <li>Need for public key infrastructure</li> <li>Public key certificate</li> <li>Enterprise public key infrastructure</li> <li>Certificate policy</li> <li>Global public key infrastructure                   <ul style="list-style-type: none"> <li>Trusted paths</li> <li>Trust models</li> <li>Choosing a public key infrastructure</li> </ul> </li> </ul> </li> <li>architecture               <ul style="list-style-type: none"> <li>Public key infrastructure interoperability</li> <li>Forms of revocation                   <ul style="list-style-type: none"> <li>Types of revocation-notification mechanisms</li> <li>Certificate revocation lists and their variants</li> <li>Server-based revocation protocols</li> </ul> </li> <li>Rekey</li> <li>Key recovery</li> <li>Privilege management</li> <li>Trusted archival services and trusted time stamps</li> </ul> </li> <li>Implementation issues               <ul style="list-style-type: none"> <li>Algorithmic weakness vs implementation weakness</li> <li>Secrecy of the algorithm is not a defense</li> <li>Types of attacks</li> <li>Overview of non-brute-force attacks</li> <li>Product certifications                   <ul style="list-style-type: none"> <li>Common Criteria</li> <li>Commercial standards</li> </ul> </li> <li>Key escrow</li> </ul> </li> <li>Applications of cryptography               <ul style="list-style-type: none"> <li>Cryptography in the OSI model                   <ul style="list-style-type: none"> <li>TCP/IP</li> <li>IPv4</li> <li>IPv6</li> </ul> </li> <li>IPSec</li> <li>Smartcards</li> <li>Biometrics</li> </ul> </li> </ul>
--	--

## Cryptanalysis

### Strategies

- Brute-force
  - Linear and differential cryptanalysis
  - Meet-in-the-middle/birthday attack
  - Timing analysis
  - Side-channel analysis
- Analysis of randomness  
Interception techniques  
Reverse engineering  
Hardware failures

## Steganography

### Definitions

### Examples

### Analysis

### Defenses

### Latest developments

### Chaffing and winnowing

### Recent algorithms

### New products

### Quantum computing effects on cryptanalysis

### Quantum cryptography

## Secure Computing Systems

### Access control

- ACLs
- capabilities
- Data- and user-oriented access control
- multi-level security
- Simultaneous access

### Identification, authentication and authorization

- accounting
- authentication
- authorization
- biometrics
- identification
- passwords
- tokens

### Design of secure systems

- architectural implications of OS for security
- design principles
- hardening OSs
- high-availability / sustainability
- inference control
- Protection based on an operating system mode
- Protection of memory
- reference monitor
- security kernels
- survival
- system design principles
- trusted operating systems; e.g., trusted LINUX
- malicious software: analysis, prevention

### Evaluation

- Common Criteria
- covert channels
- evaluation of secure systems
- penetration testing
- virus prevention

### Databases and applications

- application security -- Web servers
- database security
- developing secure distributed applications (JAVA etc.)
- secure file systems
- security databases (active directory, RADIUS, token servers, Kerberos...)

### Software development

- authenticating libraries, DLL, run-time
- buffer overflows
- develop security tools (e.g., IDS, sniffer, integrity check)
- how to write secure software
- open-source vs proprietary software and security
- quality assurance and security
- software security
- writing code
- writing patches

### Auditing

- application logging
- computer forensics/auditing and system logs, utilities,

### data

- known vulnerabilities
- logging
- intrusion detection

### Operations management

- patching systems
- physical security
- version control

## Network Security

### Protocols

- IPSec
- IPv6
- key management protocols
- multicast security
- raw sockets
- routing authentication
- routing protocols
- SSH
- TCP / UDP
- TCP state analysis
- tunneling
- VPN

### Network basics

- ISO/OSI model
- Network design
- topology
- transport-level security

### Vulnerabilities

- NOS weaknesses
- protocol vulnerabilities
- sequence-number prediction
- vulnerabilities at the different layers of the OSI

### Attacks

- DoS
- eavesdropping
- man-in-the-middle attacks
- sniffing
- spoofing
- steganography
- types of attacks (exploitation of protocol weaknesses)

### Application-layer services

- DNS Domain Name System
- E-commerce payment systems
- e-mail
- NAT
- SMTP
- Web

### Management, monitoring, auditing & forensics

- management
- SNMP
- honeypots
- intrusion detection
- monitoring
- network forensics
- traceback

### Infrastructure

- dialup security
- Ethernet switching (VLANs, . . .)
- grid security
- media
- middleware
- PKI
- protection of network infrastructure (e.g., secure routing

### protocols)

- RFI radio frequency interference
- TEMPEST / emanations control
- WANs

### Wireless & broadband

- Bluetooth
- broadband
- DSL
- satellite
- Cable
- GB Ethernet security
- WEP

### Filtering

- filtering mechanisms: static, stateful, proxy, . . .
- firewalls

## Management, Policy and Response

- Security policy guidelines
  - Terminology
  - Resources for policy writers
  - Writing the policies
  - Organizing the policies
  - Presenting the policies
  - Maintaining policies
- Security awareness
- Ethical decision-making and high technology
- Employment practices and policies
  - Hiring
  - Management
  - Termination of employment
- Operations security and production controls
  - Basic concepts
  - Operations management
  - Providing a trusted operating system
  - Protection of data
  - Data validation
- E-mail and Internet use policies
- Using social psychology to implement security policies
  
- Auditing and assessing computer systems
- Cyberspace law and computer forensics
  - Contracts
  - Defamation
  - Due diligence and private liability
  - Indecency and obscenity
  - Litigation
  - Criminal acts
  - Investigation
- Privacy in cyberspace
  - Worldwide trends
  - European approaches to privacy
  - United states
  - Compliance models

- Protecting intellectual property
- Security standards for products
  - Security assessment standards associated with security implementations
  - Establishing trust in products and systems and managing risks
  - Common criteria paradigm
- Management responsibilities and liabilities
  - Responsibilities
  - Liabilities
  - Computer management functions
  - Security administration
- Developing security policies
- Risk assessment and risk management
- Incident Response and Recovery
  - Computer emergency quick-response teams
  - Data backup and recovery
  - Business continuity planning
  - Disaster recovery
  - Insurance relief
  - Working with law enforcement
    - Goals of law enforcement
    - History of law enforcement and computer crime
    - Anatomy of a criminal investigation
    - Establishing relationships with law enforcement
  - Northwest computer technology and crime analysis
- seminar
  - Organizational policy
  - Developing internal investigative capabilities
  - Internal investigations
  - International investigations
  - Computer evidence
  - Decision to report computer crime
